Note: The results relate only to the specimens tested and should be correlated with clinical findings.

Interpretation guidance:-

- Please ensure and maintain the confidentiality of the test report.
- Testing of referred clinical specimens was considered on the basis of request/referral received from/through State Surveillance Officer (SSO) of concerned State Integrated Disease Surveillance Programme (IDSP) affirming requirements of the case definition/s.
- A single negative test result, particularly if this is from an upper respiratory tract specimen, does not exclude infection.*
- Repeated sampling and testing of lower respiratory specimens is strongly recommended in severe or progressive disease. There repeats specimens may be considered after a gap of 2 – 4 days after the collection of the first specimen for additional testing.*
- The sputum (if produced), endotracheal aspirate (ETA) or bronchoalveolar lavage (BAL) fluid would be appropriate for testing.*
- A positive alternate pathogen does not necessarily rule out either, as little is yet known about the role of coinfections.
- Please note that these results are not to be used for any thesis or presentations or for publication in any journal without the prior permission of the Director, ICMR-National Institute of Virology, Pune

Note: The results relate only to the specimens tested and should be correlated with clinical findings.

Interpretation guidance:-

- Please ensure and maintain the confidentiality of the test report.
- Testing of referred clinical specimens was considered on the basis of request/referral received from/through State Surveillance Officer (SSO) of concerned State Integrated Disease Surveillance Programme (IDSP) affirming requirements of the case definition/s.
- A single negative test result, particularly if this is from an upper respiratory tract specimen, does not exclude infection.*
- Repeated sampling and testing of lower respiratory specimens is strongly recommended in severe or progressive disease. There repeats specimens may be considered after a gap of 2 – 4 days after the collection of the first specimen for additional testing.*
- The sputum (if produced), endotracheal aspirate (ETA) or bronchoalveolar lavage (BAL) fluid would be appropriate for testing.*
- A positive alternate pathogen does not necessarily rule out either, as little is yet known about the role of coinfections.
- Please note that these results are not to be used for any thesis or presentations or for publication in any journal without the prior permission of the Director, ICMR-National Institute of Virology, Pune
